GET MORE LIVE-BORN PIGLETS

FertilityTabs

FertilityTabs has a unique composition of organic bound minerals which helps increasing the blood supply to the uterus. An increase in the blood supply means that all embryos has the same access to nutrients from conception to birth.

▼ ADVANTAGES

FertilityTabs provides large uniform live-born piglets. The litter is more uniform and the viability increases. You achieve fewer days of waste feed and a higher farrowing percentage

▼ DOSAGE

For sows

2 tablets, twice daily in 5-7 days after weaning

For gilts

1 tablet twice daily before expected heat

▼ DELIVERY

Packed in 5 kg buckets (1000 pcs.)

100 buckets / pallet

Using a unique composition of organic minerals, FertilityTabs® increases blood flow to the uterus.

This increase in blood flow means that all embryos will have the same access to nutrients.

Fastes possible absorption

During farrowing and lactation, the sow erodes violently on its built-up depots of vitamins and minerals. Once the piglets are weaned, the sow is in deficit with a large number of these vital vitamins and minerals. That is why it is important to fill up the sows depots quickly. We achieve this by giving the sow FertilityTabs.

If the sow herself lacks the essential nutrients, she will not be able to pass on these vitamins to the piglets until her own needs are met.

As it is natural and chelated vitamins and minerals that are in FertilityTabs, we achieve the absolute fastest absorption and get the sow's depots filled up even before conception. Only then, the sow is completely ready to provide high performance nutrition to the embryos in the form of nutrient rich blood without deficiencies. Then we achieve that embryos already from conception, are ready to receive

everything they need to grow. Even the piglets lying in the back of the feeding string will have access to the same nutrients as those lying in the front.

If the problem is a slow filling of the sows depots which extends into the pregnancy, then it will naturally and inevitably affect the growth of the piglets in a negative direction.

FertilityTabs are also coated so that they will dissolve and be absorbed in the small intestine and not reduced in the stomach acid.

▼ Even the embryos at the back of the feed string has access to the same nutrients as those at the front.

Meet Jørgen from Enggris and hear his story

In Danish Pig Production there has in many years been a huge focus on minimize the numbers of stillborn piglets. The problems already turned up around insemination/mating and the following time. And that's why FertilityTabs, with it's unique composition, is the right tool to reduce the numbers of stillborn piglets.

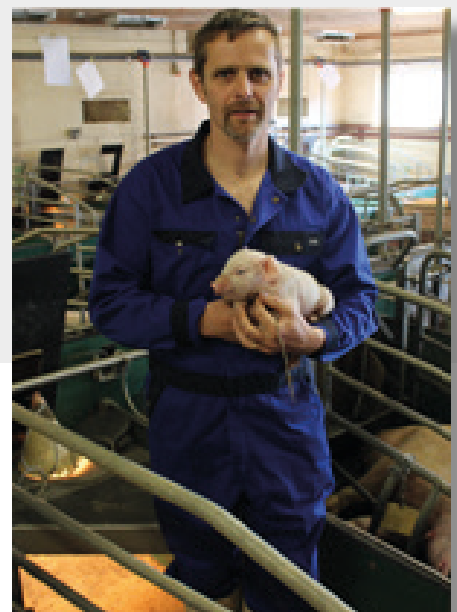

”

Every week after farrowing we could gather 5-6 litters with small underweight piglets. We have now reduces that to almost half the numbers.

Farmer Jørgen Christiansen, Director at Enggris ApS tells: "I have to say, there is a clear trend that the numbers of, live born piglets' increases by use of FertilityTabs. We have also learned a magnificent increase in stronger piglets. This

have of course shown a positive result in our production report."

The Manager at Enggris and co-owner Bernt tells: "Every week after farrowing we could gather 5-6 litters with small underweight piglets. We have now reduces that to almost half the numbers. And today we only collect around 2 litters of small piglets per week. They are also stronger than usually". Bernt tells furthermore that FertilityTabs are practical to use in there busy day at the farm, and the sows are enjoying them.

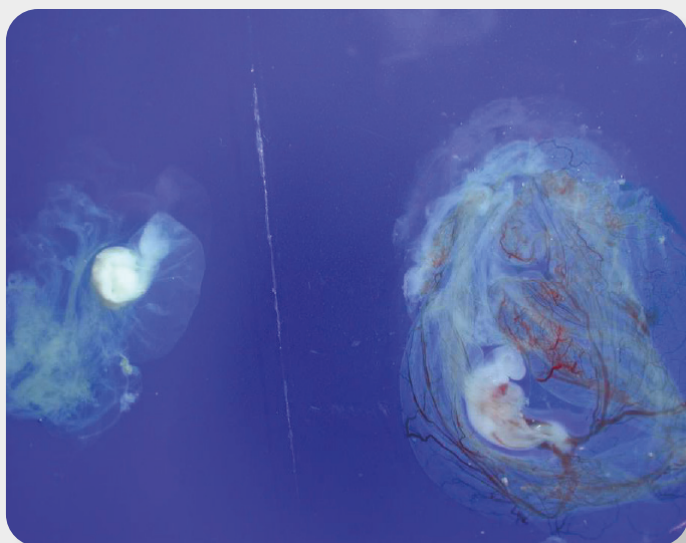

It all starts with the sow

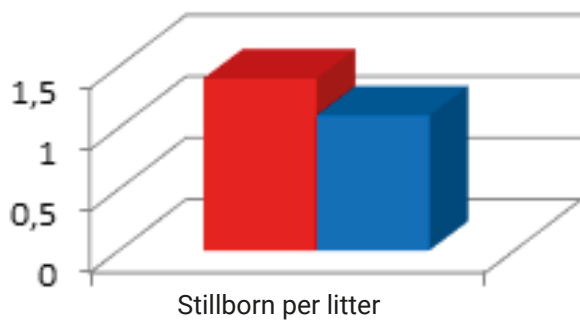

It is important to focus on the sow as this is where it all starts. In order to achieve a stronger and more uniform litter, it is important that we look at the sow's resources. In order for her to supply the necessary nutrients to the embryos, she needs to fill her own depots first.

FertilityTabs contains i.a. Fe, Cu, Mn and Zn which are essential for fertility. The use of these organic minerals helps for a better farrowing as well as a faster regeneration.

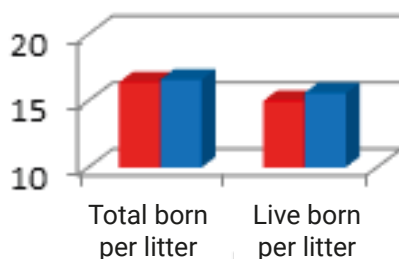

▼ *It is clear from the pictures that the blood flow is significantly improved with FertilityTabs*

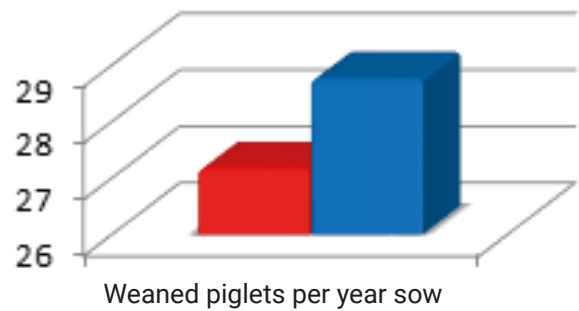

When we analyze the results from Enggris, we can clearly see the results that FertilityTabs has given.

When you look at the number of stillbirths per litter, you can see a decrease of 0.3 piglets per litter.

Live born piglets per. litter has increased by 0.6 piglets per. litter. This is a great value for the production at Enggris.

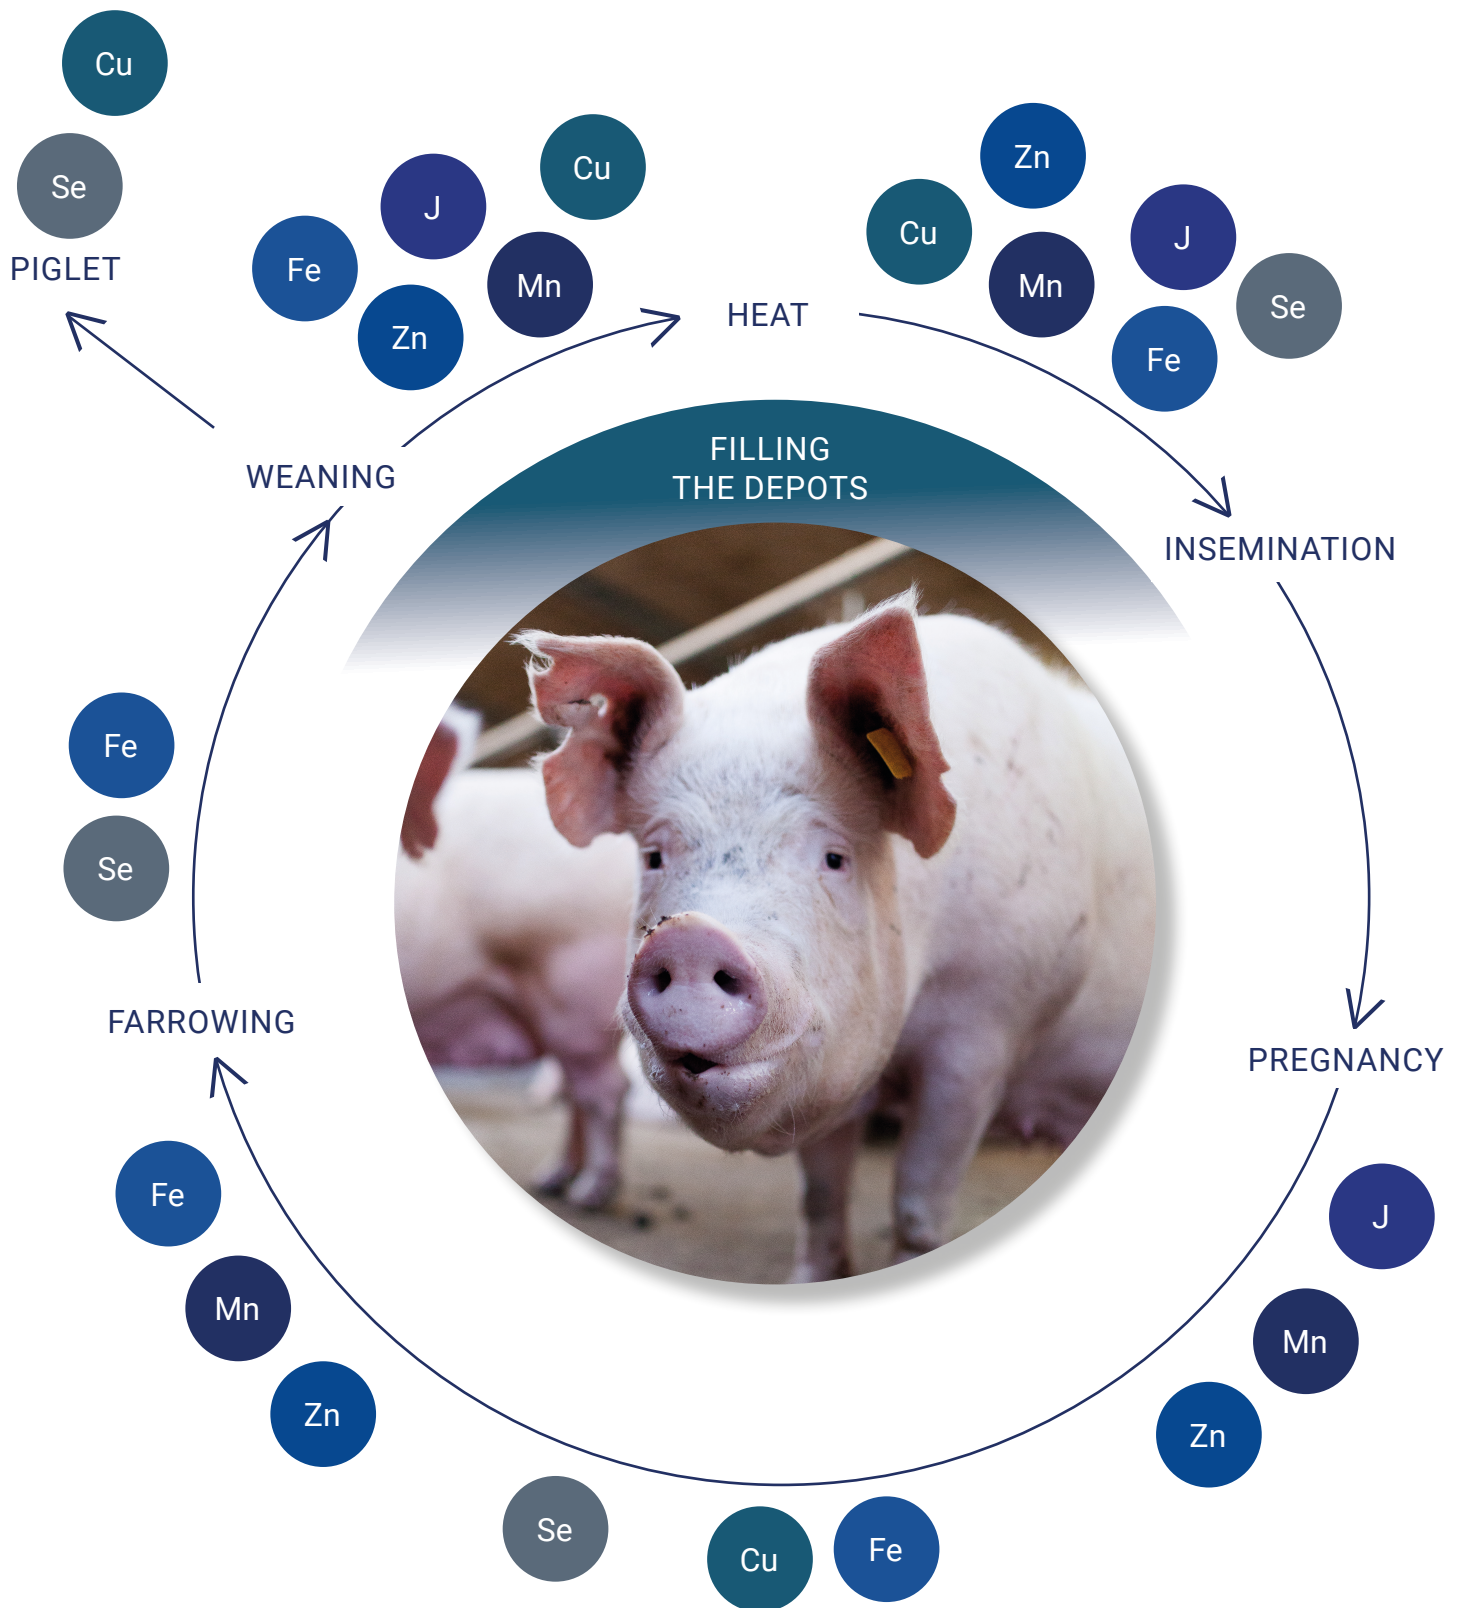

When we look at the number of weaned piglets per yearsow, we can see a significant difference when using FertilityTabs. The piglets have been much stronger and more viable by using FertilityTabs Jørgen Christiansen says with a satisfied smile on his face;

”

We have just made the new production report and the numbers keep going the right way. We will definitely use FertilityTabs for our sows in the future ”.

The importance in the filled vitamin and mineral depots
